**Converged Network Solutions Sees Huge Demand for Support of IMS
Implementation and Integration**

*Major service providers and OEM's are significantly increasing their focus on IMS
related initiatives*

DALLAS – June 1, 2005 – Converged Network Solutions (CNS) (<http://www.convergedns.com>), a convergence and IMS focused professional services company, is seeing tremendous demand for IMS support from OEM's and service providers. Brian White, Chief Marketing Officer at CNS, explained that discussions with major equipment manufacturers as well as wireless and wireline service providers have shown a critical mass being reached for IMS system development, implementation and integration.

“It has been quite amazing to see that both wireline and wireless operators are coming to the same conclusion, IMS is the architecture of choice for developing converged networks,” said Matthew Bowers, President of CNS. “CNS has talked to dozens of companies in the space and virtually all now view IMS as the long-term convergence standards winner. Early industry initiatives, by pioneers like UMA, have joined the IMS camp clearing the way for wider adoption.”

CNS, over the past 12 months, has polled telecom related companies in North America, Europe and Asia to determine future convergence requirements from each level in the value chain and what services would be most appropriate to support these clients. The company's management team has used great care in assembling a group of experienced personnel capable of delivering these high value services. CNS provides a full spectrum of services focused on assisting clients with strategy development, technology evaluation, product customization, installation and integration, and interoperability testing.

#####

About Converged Network Solutions – CNS is setting the benchmark for quality, delivering advanced professional services to the communications industry. Our team brings together hundreds of person-years of experience from such firms as SBC, Verizon, Marconi Wireless, Ericsson, Motorola, Raytheon, Texas Instruments, and Mobilestar. CNS personnel planned, built, tested, deployed and managed some of the most advanced wireline and wireless networks and equipment in the world.
